Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                              ANMO2JIO-W02332 represent the peptide portions of the beta-amyloid modulator compounds of the invention. Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of amyloid plaques are present both in the brain lesions, and in plaques. Amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a hotin containing group, or a fluorescein containing group. These compounds then modulate the aggragation of these sequences to natural amyloid proteins or peptides when contacted with the natural amyloid proteins or peptides when contacted with the natural amyloid proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as familial amyloid cardiac amyloidosis, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, familial amyloid scrapie, combuted cardiac amyloidosis, systemic senile amyloidosis, scrapie, chabetes, insulinoma, familial Mediterranean fever, familial amyloid compathy with urticaria and deaffness, hereditary cerebral hamorrhage and other types of amyloidosis. The modulators are also useful for the stream of disorders associated with beta-amyloidosis, specially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Amyloid beta peptide; Alzheimer's disease; polymerisation; aggregation; positron emission tomography; PET; Down's syndrome; amyloidosis.

```
This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of olymerisation of amyloid beta peptide (ABP), as model substances for polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a cool for the identification of other organic compounds with similar twool functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment or of flatheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch CT type) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g. positron emission tomography. New conjugates are disclosed which are of formula A-2, in which: A is (1) a cyclosporin A analogue described in AAW29087 or (2) an FK506 binding peptide inhibitor; and Z is a polypeptide comprising 5 or more contiguous residues of A-beta peptide. The compounds are novel chemical inducers of dimerization which are non-immunosuppressive and which are inhibitors of A-beta peptide aggregation and deposition in amyloid plaques. The adverse consequences of amyloid plaque formation can be prevented or ameliorated by sequestering the A-beta peptide in monomeric form with a conjugate which links the A-beta peptide in monomeric form with a conjugate mechanism to minimize the mount of free A-beta available for fibril formation and deposition. The compounds can be used for the treatment of Alzheimer, A-disease, multiple sclerosis and amyotrophic lateral sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; beta-amyloid peptide; Alzheimer's disease; amyloidogenic protein; aggregation; neurotoxicity; amyloidosis; Down's syndrome; cardiomyopathy; familial amyloid polyneuropathy; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; bay

The present invention describes beta-amyloid peptide (bAP) derivatives. The bap derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bap, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polymeuropathy or cardiomynopathy, bovine spongifican encephalopathy and Creutzfeldt-Jakob disease. The bap derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bap to labelled bap derivatives. Some bap derivatives inhibit bap aggregation a bap derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment coupled to a modifying group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or amyloidose. The modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Danish type), isolated cardiac amyloid, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, Creutzfeldt Jakob disease, adult onset diabetes, Geretmann-Straussler-Scheinker syndrome, insulinoma, isolated arrial amyloidosis, idiopathic (primary) amyloidosis, idiopathic (primary) amyloidosis, myeloma or macroglobulinaemia-associated amyloidosis, primary localised cutaneous nodular amyloidosis associated with Sjogren's syndrome, reactive (secondary), amyloidosis, familial Mediterranean Rever and familial
                                                                                                                                                                                                                                                                                     Beta-amyloid; amyloid modulator; amyloidogenic protein; amyloidosis; familial amyloid polymeuropathy; familial amyloid cardiomyopathy; isolated cardiac amyloid; systemic senile amyloidosis; scrapie; myeloma; bovine spongiform encephalopathy; BSE; Creutzfeldt-Jakob disease; adult onset diabetes; Gerstmann-Straussler-Scheinker syndrome; insulinoma; atrial amyloidosis; idiopathic amyloidosis; haemodialysis; macroglobulinaemia-associated amyloidosis; reactive amyloidosis; primary localised cutaneous nodular amyloidosis; Sjogran's syndrome; hereditary cerebral haemorrhage with amyloidosis; Muckle-Wells syndrome; hereditary non-neuropathic systemic amyloidosis;

The present invention describes an amyloid modulator compound (1) comprising an aggregation core domain and a modifying group attrached to it. (1) has noctropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation
amyloid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icelandic type, amyloidosis associated with long term haemofallysis, hereditary nonneuropathic systemic amyloidosis (familial amyloid polymeuropathy III), familial amyloidosis of Finnish type, amyloidosis associated with medullary carcinoma of the thyroid, fibrinosen-associated hereditary renal amyloidosis and lysozyme-associated hereditary systemic amyloidosis. The compound is capable of altering and inhibiting beta-amyloid protein (beta-AP) aggregation of natural amyloidosmic proteins or peptides when contacted with a molar excess amount of natural beta-APs relative to the modulator. This sequence represents a fragment of the long form of beta-amyloid used in the creation of an amyloid modulator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Alzheimer's disease; nootropic; neuroprotective; immunosuppressive; antimicrobial; auditory; amtidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polyneuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

inhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide (beta-AP). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzhahmer's disease and other clinical occurrences of beta amyloid deposition such as Down's syndrome individuals and in patients with hereditary cerebral amyloidosis, and for treating a disorder associated with toxicity of natural beta-AP aggregates to cultured neuronal cells. (I) about only reduces the formation of neurotoxicity of neuronal cells. (I) ability to reduce the neurotoxicity of performed A-beta fibrils. The present sequence represents a beta-AP peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating diseases states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (ANUIS48-ANUIS910 & AAUIS910 that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide #24, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                                                                                                                                                                 Gaps

The invention is used for treating disorder associated with amyloidosis, particularly familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Danish type), isolated cardiac amyloid, systemic senile amyloidosis, gerapie, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, Geratman-Straussler-Scheinker syndrome, adult onset diabetes, insulinoma, isolated atrial amyloidosis, idiopathic (primary)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hereditary cerebral haemorrhage; haemodialysis; thyroid;
renal amyloidosis; lysozyme-associated hereditary systemic amyloidosis;
beta-amyloid peptide; human.

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that conditions against amyloid-beta ibril formation; or (ii) an immune system modulators that prevents or inhibits amyloid-beta cortroprotective, carebroprotective (adiovascular, tranquilliser, ortophalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, ortophalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, ortophalmological, antithyroid, vasotropic, cardiovascular, mucrophic, antithyroid, antidopersesant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for service or and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for service or and can be used as amyloid-beta fibril formation modulators, and as inflated disease or anyloid-beta fibril formation for creeking or treating an anyloid-beta fibril formation modulators, and as inflated disease or anyloid-beta fibril formation or a condition associated with Alzheimer's disease (including hypothyroidism, carebroascular disease, cardiovascular descention, or a condition associated with Alzheimer's disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, parkinson's disease, amenory loss, anxiety, a behavioural dysfunction (e.g. muthing deficits, incoordination, gardical condition), and anyloid-beta alternal alternal solution, the condition of a depression, during anyloid-beta, apravioural disturbance, transient incoordination, gardion, depressed mood, irritiability, anhedonia, social withdrawal, or excessive guilt)) in a subject e.g. human having a genomic mutation in anyloid-beta deposite. The present separation and present invario
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a gecond agent (a2) that is: (ii) a peptide or peptidomimetic that agency agency (iii) a peptide or peptidomimetic that conditions amyloid-beta fibril formation, or controlly amyloid-beta fibril formation, or controlly controlly or infinite amyloid-beta fibril formation, or controlly controlly or cardiant amyloid-beta fibril formation, or controlly controlly controlly of escribed is a kit comprising (C). (C) have notropic, neuroprotective, carebroprotective, haemostatic, controlly anticonvulsant, antichportective, nationally muscular tranquilliser, uncopathic, antichportective, nationally muscular tranquilliser, uncopathic, antichportective, nationally controlly controlly cardiant, antichportective, nationally modulators. (C) can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an immune system modulators. (C) can be used for formation modulators, and as immune system modulators. (C) can be used for formation for treating an immune system modulators. (C) can be used for formation associated wild cognitive impairment, amyloid-beta related disease e.g. Altaheimer's disease (including hypothyroidism, cerebral haemorrhage, senile dementia, on one of a modition associated with Altaheimer's disease. (C) continuing hypothyroidism, creebral haemorrhage, entile dementia, one of systems in modulators and including hypothyroidism, creebral haemorrhage, senile dementia, or a condition associated with Altaheimer's disease, dementia, anticty, a behavioural dysfunction (e.g. huntington's disease, amyotrophic lareral solerois, acquired immunodeficiency, astrophyrophyroidism, creebral and anticipated immunodeficiency, for a profession, or incontinence), an neurological condition de.g. depression, or a poptidion, extand disorder, weight loss, paychosis, a sleep disturbance, insomale, behavioural disorder, w
behavioural dysfunction; neurological condition; psychological condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 70; 143pp; English.

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidominetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune response against amyloid-beta fibril formation; or fibril formation. Also described is a kit comprising (C). (C) have nootropic, neuroprotective, cerebroprotective, haemostatic, ophthalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, neuropeptic, cardiant, antidepressant, endocrine and hypnotic activities, and can, be used as amyloid-beta fibril formation modulators and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta fibril formation aliease eventing contraditary) or familial (hereditary), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cerebrovascular disease; cardiovascular disease; memory loss; anxiety;
behavioural dysfunction; neurological condition; psychological condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                           amyloid-beta fibril formation; immune response; nootropic; neuroprotective; cerebroprotective; haemostatic; ophthalmological; antithyroid; vasotropic; cardiovascular; tranquilliser; uropathic; anticonvulsant; anti-HV, antiparkinsonian; muscular; neuroleptic; cardiant; antidepressant; endocrine; hypnotic; amyloid-beta fibril formation modulator; immune system modulator; mild-to-moderate cognitive impairment; vascular dementia; cerebral amyloid amglopathy; hereditary cerebral haemorrhage; senile dementia; Down's syndrome; inclusion body myositis; age-related macular degeneration; hypothyroidism;
                                                                                                                                                                                                                                                                                                                amyloid-beta; amyloid-beta related disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 87; 143pp; English.

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that conditions amyloid-beta fibril formation, or therapeutic immune response against amyloid-beta inhibite amyloid-beta fibril formation. Also described is a kit comprising (C): (C) have nootropic, meuroprotective, cerebroporective, naemostatic, orbital antidopersessant, endocrime and hypnotic activities, orbital modification, antidopersessant, endocrime and hypnotic activities, neuroloptic, cardiant, antidopersessant, endocrime and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and a myloid-beta related disease e.g. Alzabamer's disease (including sporadic of momereditary) or familial (hereditary), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral mayloid-beta inclusion body myositis, age-related mecular dementia, now including hypothyroidism, cerebroascular disease, amyloid-beta, inclusion body myositis, age-related mecular disease, amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, compairment, or a condition associated with Alzabamer's disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, asyloid angiopathy, larred muscle croep, selarors, selarors, selarors, sensory loss, anxiety, a percenting disease, amylorophic lateral sclerosis, acquired immunodeficiency, apathy, apathy asyloid deficits, incoordination, garxia, agnosia, pick disease, amylorophic lateral sclerosis, acquired immunodeficitus, cerebra disease, apathy and apathy apathy approach or autroleptic sensitivity, normal pressure hydrocephalus, subdural disease, anylorope, neuroleptic sensitivity, normal pressure pydrocephalus, or stranding anyloid precursor protein gene, and how and deficit, frequent def
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

ANW02310-W02332 represent the peptide portions of the beta-amyloid modulator compounds of the invention. Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of anyloid plaques are present both in the brain leaions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a heterocyclic, or polycyclic group, such as declain, a cholanyl group, a betain containing group. These compounds then modulate the aggregation of these sequences to natural amyloid proteins or peptides. The modulator compounds can be used in the trearment of disorders associated with the natural amyloidogenic proteins or peptides. The modulator compounds can be used in the trearment of disorders associated with amyloidosis, such as can be used in the trearment of disorders associated with amyloidosis, scrapie, solated cardiac amyloidosis, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, familial amyloid cardiomyopathy, creutzfeldt-Jakob disease, adult-onset diabetes, insulinoma, familial Mediterranean fever, familial amyloid compournance and other types of amyloidosis. The modulators are also useful for the trearment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Beta-amyloid; modulator; amyloid plaque; brain lesion; amyloidosis; cerebral blood vessel; Alzheimer's disease; amyloidogenic protein; familial amyloid cardiomyopathy; familial amyloid cardiomyopathy; isolated cardiomyopathy; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; urticaria; adult-onset diabetes; familial Mediterranean fever; therapy; deafness; scrapie; familial amyloid nephropathy; hereditary cerebral haemorrhage.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modulator compounds of the invention. Beta-amyloid peptide is a 4

Kilodatron peptide that is the major protein component of amyloid

plaques. Amyloid plaques are present both in the brain lesions, and in

the walls of cerebral blood vessels in Alzheimer's disease patients. The

camyloid modulators of the invention comprise an amyloid ogenic protein or

peptide (such as this sequence) coupled directly or indirectly to at

least one modifying group. The modifying group is preferably a cyclic,

heterocyclic, or polycyclic group, such as declain, a cholanyl group, a

bothin containing group, or a fluorescein containing group. These

compounds then modulate the aggregation of these sequences to natural

amyloid proteins or peptides when conteacted with the natural

amyloid proteins or peptides. The modulator compounds can be used

in the treatment of disorders associated with the natural

camyloid proteins or peptides. The modulator compounds can be used

in the treatment of disorders associated with amyloidosis, such as

familial amyloid polymeuropathy, familial amyloid cardiomyopathy,

closlated cardiac amyloidosis, systemic senile amyloidosis, scrapie,

bovine spongiform encephalopathy, creutzfeldt-Jakob disease, adult-onset

diabetes, insulinoma, familial Mediterranean fever, familial amyloid

chabetes, insulinoma, familial Mediterranean fever, familial amyloid

and other types of amyloidosis, pheneditary cerebral haemorrhage

and other types of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-lagands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, specially in treatment of Alzheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g. for all and the amyloid deposits using e.g. for the prevention to mography.                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                    The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, pecifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence represents

                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid colyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and Creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives inhibit bAP aggregation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          even when bAP is present in molar excess. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta-amyloid; amyloid modulator; amyloidogenic protein; amyloidosis; familial amyloid cardiomyopathy; familial amyloid cardiomyopathy; isolated cardiac amyloid, systemic senile amyloidosis; scrapie; myeloma; bovine spongiform encephalopathy; BSE; Creutzfeldt-Jakob disease; adult onset diabetes; Gerstmann-Straussler-Scheinker syndrome; insulinoma; atrial amyloidosis; idiopathic amyloidosis; haemodialysis; macroglobulinaemia-associated amyloidosis; reactive amyloidosis; primary localised cutaneous nodular amyloidosis; Sjogren's syndrome; hereditary cerebral haemorrhage with amyloidosis; Muckle-Wells syndrome;
                                                                                                                                                                                                        New peptide(s) derived from beta-amyloid peptide that inhibit amyloid aggregation - and neurotoxicity, specifically for treatment and prevention of Alzheimer's disease.

```
The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or peptides. The modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid cardiomyopathy (Danish type), and Swedish types), familial amyloid cardiomyopathy (Danish type), isolated cardiac amyloid septemic senile amyloidosis, scrapie, bovine spongiform encephalopathy. Creuzfeldt-Jakob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated atrial amyloidosis, idiopathic (primary) amyloidosis, modular amyloidosis, idiopathic (primary) amyloidosis, myeloma or macroglobulinaemia-associated myloidosis, primary localised cutaneous nodular amyloidosis associated with Sjogren's syndrome, reactive (secondary) amyloidosis, familial Mediterranean Fever and familial amyloidosis associated with long term haemofialysis, hereditary non-chercopathy with urticaria and dasfiness (Muckle-Wells syndrome), hereditary carebral haemorrhage with amyloidosis associated with 111), camyloidosis associated with long term haemofialysis, hereditary in the contropathy of the thyroid, fibrinogen-associated with compound is capable of altering and inhibiting betamyloidosis. The compound is capable of altering and inhibiting betamyloid protein (beta-AP) aggregation of natural amyloidosis capable or amyloid protein (beta-AP) aggregation of natural amyloid southlator. This sequence represents a fragment of the creatative to the modulator. This sequence represents a fragment of the torestice or peptides when contacted with a molar excess amount of natural beta-APs long form of beta-amyloid used in the creation of an amyloid modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                    Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Beta-amyloid; amyloid modulator; amyloidogenic protein; amyloidosis; familial amyloid polyneuropathy; familial amyloid cardiomyopathy; solated cardiac amyloid; ystemic senile amyloidosis; scraple; myeloma; bovine spongiform encephalopathy; BSE; Creutzfeldt-Jakob disease; adult onset diabetes; Gerstmann-Straussler-Scheinker syndrome; insulinoma; atrial amyloidosis; idiopathic amyloidosis; haemodialysis; macroglobulinaemia-associated amyloidosis; reactive amyloidosis; primary localised cutaneous nodular amyloidosis; Sjogren's syndrome; hereditary cerebral haemorrhage with amyloidosis; Muckle-Wells syndrome; hereditary non-neuropathic systemic amyloidosis;

```
The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or compound modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid cardiomyopathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Portuguese, Japanese consolated cardiac amyloid, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated artial amyloidosis, insulinoma, isolated cardial amyloidosis, insulinoma, isolated cardial amyloidosis, primary localised cutaneous nodular amyloidosis, familial Mediterranean Fever and familial camyloidosis associated with Siggren's syndrome, reactive (secondary) amyloidosis, familial Mediterranean fever and familial camyloidosis associated with amyloidosis of Icelandic type, hereditary carcinoma of the thyroid, fibrinogen-associated hereditary creating and lysozyme-associated hereditary systemic amyloidosis (familial amyloidosis and lysozyme-associated hereditary systemic camyloidosis (familial amyloidosis and lysozyme-associated hereditary systemic camyloidosis. The compound is capable of altering and inhibiting beta-amyloidosis and lysozyme-associated hereditary systemic camyloidosis. The compound is capable of altering and inhibiting beta-amyloidosis when contacted with a molar excess amount of natural beta-APs crelative to the modulator. This sequence represents a fragment of the call or call amyloid protein (beta-AP) aggregation of natural amyloidosis and lysozyme-associated hereditary systemic call amyloidosis (amyloidosis associated beta-APs and a modulator reseasement of natural beta-APs call amyloidosis associated beta-APs and a modulator of natural amyloidosis and lysozyme-associated beta-amyloid brotein the codulator rhis sequence represents a fragment of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                           Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment coupled to a modifying group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Alzheimer's disease; nootropic; neuroprotective; immunosuppressive; antimicrobial; auditory;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EXXXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                        The present interaction describes an emytation comportant of the present interaction described an aggregation corre domain and a modifying group attached to it. (I) has nootropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide (beta-APD). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's disease and other clinical occurrences of beta amyloid deposition such as Cown's syndrome individuals and in patients with hereditary cerebral haemorrhage with amyloidosis, and for treating a disorder associated with amyloidosis, and for treating a disorder associated with anyloidosis, and for treating a disorder associated with conjoint such as familial amyloid polymeuropathy. (I) reduces the constituted neuronal cells. (I) on the condition of neurotoxic aggregates to cultured neuronal cells. (I) ability to reduce the neurotoxicity of performed A-beta fibrils. The community is the present and the properties, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                 Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.
antidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polymeuropathy.

(I) has nootropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide (beta-Ap). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzhaimer's disease and other clinical occurrences of beta amyloid deposition such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Down's syndrome individuals and in part of the predicary cerebral haemorrhage with amyloidosis, and for treating a disorder associated with haemorrhage with amyloidosis, and for treating a disorder associated with amyloidosis such as familial amyloid polyneuropathy. (I) reduces the toxicity of natural beta-AP aggregates to cultured neuronal cells. (I) not only reduces the formation of neurotoxic aggregates but also have the present sequence represents a beta-AP peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.
antidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polymeuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antibody molecule; antibody; beta-A4 peptide; Abeta4; neuroprotective; nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia;

The present invention describes an antibody molecule (1) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Set-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-CG Aly ADA89888 or its fragment, and the second region comprises the candino acid sequence val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-CG amino acid sequence val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-CC antion of the vector of (2); (4) preparing (1), comprising (1); (2) a vector comprising the nucleic acid of (1); (3) a host ccl conturing the host cell of (3) under conditions that allow synthesis of culturing the host cell of (3) under conditions that allow synthesis of corrected of (1); vector of (2); (4) preparing (1); (5) a kit comprising (1) or an antibody molecule produced by method (4); (6) a kit comprising (1); (7) and recovering (1) from the culture; (5) a composition comprising (1); (8) testing the resulting Fab optimised clones; (10) expressing (1); (8) testing the resulting Fab optimised clones; (10) expressing (1); (8) testing the resulting potimisation of (1); (1) has paramed antibody/antibody molecule with a carrier; and (12) a pharmaceutical composition preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with anyloidogenesis and/or amyloid-plaque formation. The antibody molecule confusion for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above and antipation of passive immunisation against beta-amyloid plaques or for passive immunisation and anipatus formation. In particular, the disease is
                                                                                                                                                                        antibody molecule; antibody; beta-A4 peptide; Abeta4; neuroprotective; nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer: g disease; motor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kretzschmar

                                                                                                                    The invention relates to amyloidogenic proteins or peptide fragments asgregation modulators. The invention is used for treating disorder associated with amyloidosis, particularly familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid acadiomyopathy (Danish type), isolated cardiac amyloid, systemic senile amyloidosis, gerapie, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, Geratmann-Straussler-Scheinker syndrome, adult onset diabetes, insulinoma, isolated atrial amyloidosis, idiopathic (primary) localized cutaneous nodular amyloidosis, idiopathic (primary) localized cutaneous nodular amyloidosis, sasociated amyloidosis, primary localized cutaneous nodular amyloidosis, familial Mediterranean Fever and familial amyloid nephropathy with urricaria and deafiness (Mucklement amyloidosis) amyloidosis, primary amyloidosis, manisalmess (Mucklement amyloidosis) amyloidosis, primary amyloidosis, primary amyloidosis, familial amyloidosis, primary amyloidosis, primar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icelandic type, amyloidosis associated with long term haemodialysis, hereditary non-neuropathic systemic amyloidosis (familial amyloid polymeuropathy III), familial amyloidosis of Finnish type, amyloidosis associated with medullary carcinoma of the thyroid, fibrinogen associated medulary carcinoma of the thyroid, fibrinogen associated medulosis. The present sequence is beta-amyloid peptide fragment used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cērebrovascular diseasē, cardiovascūlar disease, memory loss, anxiety, behavioural dysfunction, neurological condition; psychological condition, vaccine antigen.

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that conditions anyloid-beta fibril formation; or (ii) an immune response against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta corprished; antithyroid; antithyroid; arkinorective, carebroperoctic, cardiovascular, tranquilliser, uropathic, anticonvulsament, antithyroid; and anyloid-beta fibril formation medulators, and as immune system modulators (C) can be used for preventing or treating an amyloid-beta fibril formation modulators, and as immune system modulators (C) can be used for preventing or treating an amyloid-beta fibril formation modulators, and as immune system modulators (C) can be used for preventing or treating an amyloid-beta fibril formation modulators, and as immulated disease of a amploid-beta fibril formation modulators, and as immulated disease of e.g. Alzheimer's disease (including sporation) or a condition associated with Alzheimer's disease.

C (non-hereditary) or familial (hereditary) immid cognitive impairment, mild-to-moderate cognitive impairment, vascular disease, cardiovascular dementia, commid-to-moderate cognitive investigance cerebral heamorrhage, senile dementia, bown's syndrome, inclusion body myositis, age-related meacular dementia, cageneration, or a condition associated with Alzheimer's disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, parkinson's disease, amyotrophic lateral acteriors, amonory, arxinson's disease, amyotrophic lateral acteriors, amonory, arxinson's disease, amyotrophic lateral active fore, sellution, getta disturbance, transient alertines, attention deficit, frequent fallowing active, transient alertines, attention deficit, frequent alertines, atte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                               Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indels

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related diseas; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation; or (therapeutic immune response against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta fibril formation; or (iii) an immune system modulator that prevents or inhibits amyloid-beta (ibril formation. Also described is a kit comprising (C). (C) have notropic, neuroprofective, cerebroprofective, haemostatic. (C) have notropic, neuroprofective, cerebroprofective, haemostatic. coptibility antichyroid, vasotropic, cardiovascular, tranquilliser, uropathic, auticonvulsant, anti-HIV, antiparkinsonian, muscular, neurolegitic, cardiant, amidepressant, endocrine and hyporic activities, and can be used as amyloid-beta fibril formation modulators, and as mayloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, vasotlar dementia, campled angiopathy, hereditary cerebral haemorrhage, senile dementia, amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, coperation, or a condition associated with Alzheimer's disease, dementian, cor a condition associated with Alzheimer's disease, amyloid angiopathy, or a condition associated with Alzheimer's disease, dementian, cor a condition associated with Alzheimer's disease, dementia, condition (e.g. apathy, aggression, or incontinnee), an eurological condition (e.g. spathy, aggression, or incontinnee), an eurological condition (e.g. with Lewy bodies allered muscle tone, seizures, sensory loss, usucidal deficite, incoordination, gait disturbance, transtent sendentia, cor stroke, transisent alerted muscle condition (e.g. depression, delusion), hallucination, sexual disorder, weight (ideation), allusion, hallucination,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cerebrovascular disease, cardiovascular disease, memory loss, anxiety; behavioural dysfunction; neurological condition; psychological condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
amyloid-beta fibril formation; immune response; nootropic; neuroprotective; carebroprotective; haemostatic; ophthalmological; antithyroid; vasotropic; cardiovascular; tranquilliser; uropathic; anticonvulsant; anti-HIV; antiparkinsonian; muscular; neuroleptic; cardiant; antidepressant; endocrine; hypnotic; amyloid-beta fibril formation modulator; immune system modulator; Alzheimer's disease; mild cognitive impairment; mild-to-moderate cognitive impairment; vascular dementia; eserbaral amyloid angiopathy; hereditary cerebral haemorrhage; senile dementia; Down's syndrome; inclusion body myositis; age-related macular degeneration; hypothyroidism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 87; 143pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          24-DEC-2003; 2003WO-CA002021.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    24-DEC-2002; 2002US-0436379P.

Also described is a kit comprising (C). (C) have nootropic, neuroprotective, cerebroprotective, haemostatic, ophthalmological, antithyroid, vasotropic, cardiovascular, tranquilliser,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
having amyloid-beta deposits. The present sequence represents a beta-
amyloid modulator peptide which is used in the exemplification of the
present invention.

Advantation would be the invention of the Deca-amyloid decided to modulator compounds of the invention. Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of amyloid plaques are present both in the brain lesions, and in plaques. Amyloid plaques are present both in the brain lesions, and in the amils of carebral blood vessels in Alzheimer's disease patients. The camploid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a biotin containing group. The modifying group. These compounds then modulate the aggregation of these sequences to natural amyloid proteins or peptides when contacted with the natural amyloid proteins or peptides when contacted with the natural anyloid proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as familial amyloidosis, septemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, familial amyloidosis, scrapie, conditions anyloidosis, familial amyloidosis, familial amyloid nephropathy with urticaria and deafness, hereditary cerebral haemorrhage and other types of amyloidosis. The modulators are also usefully far the farther associated with beta-amyloidosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amyloid beta peptide; Alzheimer's disease; polymerisation; aggregation; positron emission tomography; PET; Down's syndrome; amyloidosis.

                                                                                                                                                                                                                                                                                                                                                            RESULT 34
                                                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                     吕
                                                                                                                  This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of anyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar the functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment or prevention of demens in patients with amyloidosis, for treatment or prevention of demens in patients with bown's syndrome, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch type) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g.
                                                                                                                                                                                                                                                                                                                                                                       o;

                                                                                                                                                                                   The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and prevential cardiomyopathy, by by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation when when the paresent in molar excess. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Beta-amyloid, amyloid modulator; amyloidogenic protein; amyloidosis; familial amyloid cardiomyopathy; isolated cardiac amyloid, systemic senilal amyloidosis; scrapie; bovine cardiac amyloid, systemic senila amyloidosis; scrapie; myeloma; bovine spongiform encephalopathy; BSB; Crettzfeldt-Jakob disease; adult onset diabbetes; Gerstmann-Straussler-Scheinker syndrome; insulinoma; atrial amyloidosis; idiopathic amyloidosis; haemodialysis; macroglobulinaemia-associated amyloidosis; reactive amyloidosis; primary localised cutaneous nodular amyloidosis; Sjogren's syndrome; hereditary non-neuropathic systemic amyloidosis; muckle-Wells syndrome; familial Mediterranean Fever.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
aggregation - and neurotoxicity, specifically for treatment and prevention of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       a bAP derivative
```

```
The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or compound modulates the aggregation of natural amyloid proteins or and swedish types), familial amyloid cardiomyopathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Danish type), isolated cardiomyopathy (Danish type), creutzfeldt-Jākob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated artial amyloidosis, idiopathic (primary) amyloidosis, modilar amyloidosis, familial Mediterranean Fever and familial condular amyloidosis associated with Sjogren's syndrome, reactive (secondary) amyloidosis, familial Mediterranean Fever and familial amyloidosis associated with Sjogren's syndrome, reactive camyloidosis associated with amyloidosis of Icalandic type, exploidosis associated with amyloidosis of Icalandic type, camyloidosis of the thyroid, fibrinogen-associated with III), camyloidosis associated hereditary systemic amyloidosis of the thyroid, fibrinogen-associated hereditary carcinoma of amyloidosis associated with a molar excess amount of natural beta-APPs cor peptides when contacted with a molar excess amount of natural beta-APPs creative to the modulator. This sequence represents a fragment of the corporation of natural percentance cor peptides when contacted with a molar excess amount of an amyloid modulator. This sequence represents a fragment of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Alzheimer's disease; nootropic; neuroprotective; immunosuppressive; antimicrobial; auditory; amtidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polyneuropathy.

The present invention describes an amyloid modulator compound (I) comprising an aggregation core domain and a modifying group attached to it. (I) has nootropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide (beta-Ap). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzhaimer's disease and other clinical occurrences of beta amyloid deposition such as Down's syndrome individuals and in patients with hereditary cerebral
                                                                                                                                                                                                                                                                                                                                                                                                         haemorrhage with amyloidosis, and for treating a disorder associated with amyloidosis such as familial amyloid polyneuropathy. (1) reduces the toxicity of natural beta-AP aggregates to cultured neuronal cells. (1) not only reduces the formation of neurotoxic aggregates but also have the ability to reduce the neurotoxicity of performed A-beta fibrils. The present sequence represents a beta-AP peptide, which is used in the
                                                                                                  Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzhaimer's disease comprises an aggregation core domain and a modifying group attached to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amyloidogenic protein; therapy; amyloidosis; familial amyloid polyneuropathy; cardiomyopathy; familial amyloid polyneuropathy; cardiomyopathy; gystemic senile amyloidosis; bovine spongiform encephalopathy; cretuzfeldt-Jakob disease; derstmann-Straussler-Scheinker syndrome; diabetes; insulinoma; myeloma; Sjogren's Syndrome; familial mediterranean fever; urticaria; deafiness; hyyroid; hereditary cerebral haemorthage; haemodialysis; thyroid; renal amyloidosis; lysozyme-associated hereditary systemic amyloidosis;

                                                                                                                                                                                                                      The invention relates to amyloidogenic proteins or peptide fragments aggregation modulators. The invention is used for treating disorder aggregation modulators. The invention is used for treating disorder aggregation modulators. Particularly familial amyloid polymeuropathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Portuguese, Japanese and Swedish types), familial amyloidosis, scrapie, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, Gerstmann-Straussler-Scheinker syndrome, adult onset diabetes, insulinoma, isolated atrial amyloidosis, idiopathic (primary) amyloidosis, myeloma or macroglobulinemia-associated amyloidosis, primary localized cutaneous nodular amyloidosis, familial Mediterranean Fever and familial amyloid nephropathy with urticaria and deafness (Muckier Syndrome), hereditary cerebral haemorrhage with amyloidosis of cereditary non-neuropathic systemic amyloidosis of Finnish type, amyloidosis polymeuropathy III), familial amyloidosis of Finnish type, amyloidosis and lysozyme-associated hereditary senal amyloidosis and lysozyme-associated hereditary senal amyloidosis and lysozyme-associated hereditary systemic amyloidosis. The present sequence is beta-amyloid peptide fragment used amyloidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        amyloid-beta; amyloid-beta related disease;

The present invention describes compositions (C) comprising: (a) a first capture (a1) that prevents or treats amyloid-beta related disease; and (b) agencial (a1) that prevents or treats amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta aprophylactic or therapeutic immune response against amyloid-beta prophylactic or (ii) an immune system modulators that prevents or inhibits amyloid-beta modulators antithyroid, vasotropic, cardiovascular, tranquilliser, or pothalmological, antithyroid, vasotropic, cardiovascular, tranquilliser, or intornvilasmic, antithyroid, vasotropic, cardiovascular, tranquilliser, or and can be used as amyloid-beta fibril formation and hypnotic activities, or and can be used as amyloid-beta fibril formation modulators, and as immune system modulators (C) can be used for disease (including sporadic (non-hereditary) or familial (hereditary), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral mayloid-beta related with Alzheimer's disease (including sporadic or myloid-beta related with Alzheimer's disease (including sporadic complexity) or familial (hereditary), mild cognitive impairment, or acondition associated with Alzheimer's disease (including hypothyroidism, cerebral haemorrhage, senile dementia, Down's syndrome, inclusion body myositis, agencial condition (e.g. apathy disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, Down's syndrome, inclusion associated with Alzheimer's disease, dementia disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, Parkinson's disease, apasia, apraxia, agnosia, pick disease, dementia, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural field deficits, incoordination, gait disturbance, transient alertness, attention deficit, frequent syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural disease, or any persential disease, and proper neuroleptic sensitivity, normal pressure pydrocephalu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present invention describes compositions (C) comprising: (a) a first agent (al) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidominetic that condulates amyloid-beta fibril formation or induces a prophylactic or thereapeutic immune response against amyloid-beta fibril formation, or therapeutic immune system modulator that prevents or inhibits amyloid-beta (ii) an immune system modulator that prevents or inhibits amyloid-beta (iii) an immune system modulator that prevents or inhibits amyloid-beta contropic, neuroprotective, cerebroprotective, haemostatic, (C) have copthalmological, antithyroid, vasotropic, cardiovacular, tranquilliser, uropathic, anticonvulsant, anti-HIV, antiparkinsonian, muscular, coupathic, anticonvulsant, anti-HIV, antiparkinsonian, and as and can be used as amyloid-beta fibril formation modulators, and as and can be used as amyloid-beta fibril formation modulators and as myloid-beta related disease e.g. Alzheimer's disease (including sporadic mild-to-moderate cognitive impairment, vascular dementia, cerebral myloid anglopathy, hereditery cerebral haemorrhage, senile dementia, cappand, syndrome, inclusion body myositis, age-related macular myloid anglopathy, hereditery cerebral haemorrhage, senile dementia, cerebrand syndrome, inclusion body myositis, age-related macular cerebral anyloid anglopathy, hereditery, a behavioural dysfunction (e.g. Huntington's agenession, or incontinence), a neurological condition (e.g. Huntington's disease, amyotrophic lateral sclerosis, acquired immunodeficiency, dementia apraxia, agnosia, pick disease, dementia
                                                                                                                                                                                                                     wayloid-beta; amyloid-beta related disease;
w amyloid-beta fibril formation; immune response; nootropic;
w neuroprotective; cerebroprotective; hemostatic; ophthalmological;
w neuroprotective; cerebroprotective; hemostatic; ophthalmological;
w netitivycid; vasotropic; cardiovascular; tranquilliser; uropathic;
w antichycoid; vasotropic; cardiovascular; muscular; neuroleptic;
w artichopressant; endocrine; hypnotic;
w artichopressant; endocrine; hypnotic;
w anyloid-beta fibril formation modulator; immune
w Alzheimer's disease; mild cognitive impairment;
w hild-to-moderate cognitive impairment; vascular dementia;
cerebral amyloid angiopathy; hereditary cerebral haemorthage;
w age-related macular degeneration; hypothyroidism;
cerebrovascular disease; cardiovascular disease; memory loss; anxiety;
w behavioural dysfunction; neurological condition; psychological condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 87; 143pp; English.

RESULT 38
                         ADQ37349
```

```
Recombinant polypeptides produced using the coding sequences of mutant forms of amyloid precursor proteins comprising from the 5' to the 3' end a sequence encoding a marker and either (1) a sequence encoding the Nuterinus of an amyloid precursor protein (APP) up to, but not including, the nucleotides encoding the beta amyloid protein (BAP) domain or (2) the BAP domain; or the two ligated together, can be used to detect drugs or compounds that inhibit/augment the activity of proteolypic enzymes which patients with Alzheimers disease and Down's syndrome). This is a fragment of amyloid precursor protein containing a mutation which is associated with diseases involving BAP deposition
                                                                                                                                                                                                                                                                                                                                                                     ö
with Lewy bodies, altered muscle tone, seizures, sensory loss, visual field deficits, incoordination, gait disturbance, transient ischaemic attack or stroke, transient alertness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural haematona, brain tumour, postrammatic brain injury, or posthypoxic damage), or a psychological condition (e.g. depression, delusions, illusion, hallucination, sexual disorder, weight loss, psychosis, a sleep disturbance, insomnia, behavioural dispinibilion, poor insight, suicidal ideation, depressed mood, irritability, anhedonia, social withdrawal, or excessive guilt) in a subject e.g. human having a genomic mutation in an amyloid precursor protein gene, an ApoB gene, or a presentin gene; having amyloid-beta deposits. The present sequence represents a beta-amyloid modulator peptide which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New mutant forms of amyloid precursor protein - for detecting cpds. that modify activity of enzymes involved in precursor cleavage, also new

Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of bolymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar thuctional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment of Alzheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, for treatment or prevention of hereditary cerebral haemorthage with amyloidosis (Dutch type) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules with similar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   properties and/or as ligands for detection of amyloid deposits using e.g. positron emission tomography.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a novel peptide compound comprising Lys-
His-Tyr-beta-alanine, which has a memory modulating effect. The peptide
has nootropic activity. The peptide can be used for the development of
topographic models useful to design and synthesise memory-enhancing and
life-quality improving substances. The peptide compound restores the
balance between excitatory and inhibitory systems in the brain, which is
required for optimal acquisition and retention of learning and helps to
correct defects in the balance that arise as a result of aging,
infections and injury. The substances exert recoperateicising effects on
nervous system function and has more prolonged desired effects at lower
doses than the peptide structures. The substances mimic the action of
active peptides without having a peptide structure and do not subject to
degradation of peptide-splitting enzymes in the gut or other tissues. The
present sequence represents a human amploid beta protein (beta-A4)
peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                     New peptide compound useful for design of substances that enhance memory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide #20, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral amyloid haemorrhagic trype and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                     Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analyzing cleavage of polymer, by providing polymer sample, incubating the sample with labeled isotope for cleavage at potential cleavage site, and analyzing the masses of any uncleaved fragments by mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mass spectrometry; polymer; analysis; cleavage; substrate specificity; isotope; protease.

The present invention describes a method (M1) for analysing cleavage of a polymer. M1 comprises: (a) providing a sample of the polymer, a portion of the polymer molecules having been labeled at a position on one side of the potential cleavage site with a first isotopic label and a portion of the potential cleavage site with a first isotopic label; (b) side of the potential cleavage site with a second isotopic label; (b) incubating the sample under conditions suitable for cleavage at the potential cleavage site; and (c) analysing the mass(es) of any cleaved incubating the sample under conditions suitable for cleavage at the potential cleavage site; and (c) analysing the mass(es) of any cleaved conditions suitable for cleavage at the polymer; where cleavage has taken place. M1 is useful for analysing cleavage of a polymer, where the polymer; is a linear polymer, and comprises a peptide or protein. Methods from the present invention can be used in discovering cleavage of from the present invention can be used in discovering cleavage dentified from the human genome. The methods are also useful to identify the sequence origin, and in screening methods to identify new substrates for enzymes, in positional peptide scanning clibraries, in in vivo/ex vivo/in vitro peptide, and in assaying methods con polymerides in expression. The methods are useful for monitoring the cleavage of polymerides or polymorleotides, and for determining optimal polymer cuberning contined the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; postiasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Prevention and/or treatment of an amyloid-related disease e.g.

```
The invention relates to a method for prevention and/or treatment of an anyloid-related disease which comprises administration of an all-D-amyloid-related disease which comprises administration of an all-D-amyloid-bet apptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and caronic angiopathy; for altering serum levels of amyloid-beta in amymal and the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including carbinatory diseases e.g. rheumatory atthritis, psoriatic arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, carbinitis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, carbinitis, ankylosing spondylitis, psoriasis, bronchiectasis, decubitus infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus culcers, chronic pyelonephritis, otheromyelitis and Whipple's disease).

Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymbhoma, renal carcinoma of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The formation of the present sequence is an Abeta peptide used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New amyloid beta peptide, useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated amyloid beta peptide or its homologue which is selected by a method comprising: (a) determining the binding value of each amino acid of a subsequence of amyloid beta peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
 Alzheimer's disease, comprises use of all-D-amyloid-beta peptides.

upon binding to a HLA class 1 and/or class II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, based on the binding value of each amino acids obtained in step (1); and (c) comparing the resulting score to a preselected value. Also described: or diluent; (2) determining T-cell epitopes within amyloid beta peptide; or diluent; (2) determining T-cell epitopes within amyloid beta peptide; (3) predicting the reaction of an individual to a vaccine; (4) matching a vaccine comprising a beta amyloid or homologue peptide to an individual, (c) a kit for matching a vaccine comprising a myloid beta peptide beta peptide to an individual based on the HLA haplotype of the individual; (5) a kit for matching a vaccine comprising amyloid beta peptide has neuroprotective activity, and can be used in vaccines. The amyloid beta peptide is useful for preparing a composition or progression of amyloid plaques for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. The present an amyloid beta (Abeta) peptide, which is used in an example for the present an amyloid beta (Abeta) peptide, which is used in an example

The present invention describes an isolated amyloid beta peptide or its bindlogue which is selected by a method comprising: (a) determining the binding value of each amino acid of a subsequence of amyloid beta peptide upon binding to a HiA class I and/or class II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, based on the binding value of each amino acids obtained in step (1); and (c) comparing the resulting score to a preselected value. Also described: (1) a vaccine comprising the isolated amyloid beta peptide and a carrier

New amyloid beta peptide, useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease.

Example 6; SEQ ID NO 135; 69pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel composition comprising a complex of radioisotope technetium (Tc) with an aza-diaminadioxime ligand. The composition of the invention may be useful in radiopharmaceuticals for mammalian administration, to be used in diagnostic imaging of thrombi. The composition comprises minimised amounts of lipophilic technetium complex species, thus improving the overall imaging characteristics. The
or diluent; (2) determining T-cell epitopes within amyloid beta peptide; (3) predicting the reaction of an individual to a vaccine; (4) matching a vaccine comprising a beta amyloid or homologue peptide to an individual, for immunisation of an individual based on the HLA haplotype of the individual; (5) a kit for matching a vaccine comprising amyloid beta peptide to an individual based on the HLA haplotype of the individual; and (6) preventing the formation or progression of amyloid beta mayloid beta peptide is useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. The present sequence represents an amyloid beta (Abeta) peptide, which is used in an example
                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition useful in radiopharmaceuticals for diagnostic imaging of thrombi comprises complex of radioisotope technetium with aza-

composition does not form a diastereomeric complex as it does not contain a chiral centre and hence does not require purification of the particular isomers. The current sequence is that of the radioisotope technetium (TC) -related peptide 2 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or

The present invention describes compositions (C) comprising: (a) a first capture (1a) that prevents or treats amyloid-beta related disease; and (b) agencial (1b) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation; or therapeutic immune response against amyloid-beta arbitation or induces a prophylactic or therapeutic immune response against amyloid-beta arbitation (c): (C) have modulators and influy antiparkinsonian (D): (C) have nocropic, neuroprotective, carebroprotective, heamostatic, cophthalmological, antichyroid, vasotropic, cardioara, mentionvalasmit, antichyroid, vasotropic, cardioara, mendulators and hyphotocatic, cardiant, antichyroid, vasotropic, cardioara, modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic formation, or a condition and pamenrhage, senile dementia, on anyloid-apthy, hereditary cerebral heamorrhage, senile dementia, on incontinence), a heurological condition (e.g. apathy, disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, disease, memory loss, anxiety, a behavioural dysfunction (e.g. manyloid-apteral algebra, and anyloid-apteral anyloid-algorial condition, and condition, and anyloid-algorial condition, gait disturbance, translent isdaemic attack or stroke, translent alertness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural ideation, depressed mayod, irritability, anhedonia, social withderawal, or excessive guilt)) in a subject e.g. human having a genomic mutation in an aubject e.g. human having a genomic mutation in an aubject e.g. human having a genomic mutation or having amyloid-beta and ap Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                         for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cytoprotection for treating amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.

The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid-beta peptide (dese AABS622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acid to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. The peptides need not be aggregated to be operative or immunogenic. The beta-sheet region or at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptides and the all-D peptides of in AABS2613-64. The vaccine elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and associated cellular toxicity. The amyloid related diseases may be localised amyloidosis, e.g. diabetes type II,

                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
neurodegenerative diseases, e.g. bovine spongiform encephalitis, Creutzfeldt-Jakob disease, scrapie, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. rheumatoid arthritis), familial Mediterranean fever (FMF) and systemic amyloidosis found in long-term haemodialysis patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABS622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic
                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                       Alzheimer's disease; amyloidosis; amyloid-related disease; vaccine;

                       immunogenic peptidomimetics. Examples include all-D peptides corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and 36-42 of the amyloid-beta peptide and the all-D derivative peptides given in AAB82623-64. The vaccine elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and associated cellular toxicity. The amyloid anguagementive diseases may be localised amyloidosis, e.g. disbates type II, neurodegenerative diseases, scrapie, cerebral amyloid angiopathy, and prion procein related disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. rheumatcoid arthritis), familial Mediterranean fever (FMF) and systemic amyloidosis found in long-term haemodialysis patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an amyloid-targeting imaging agent comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

cc amyloid targeting moiety, a linker moiety and a labelling moiety. The agent is of general formula A.t.(A.l.n.k) z.A.l.a.b (1) where z = 0 - 1; cc a labelling moiety. A.l.n.k = a linker moiety; and A.l.a.b cc = a labelling moiety. Also included are Imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving cdiagnosing an amyloid-related condition advised to determine the presence of amyloid or amyloid-related condition cc administering (1) to the patient, and ultrasound imaging (1) in the patient to determine the presence of amyloid or amyloid-related condition; and a kit for preparation aradiopharmaceutical preparation comprising (1), a reducing agent, a buffering agent, attanschelating agent, and (1), a reducing agent, and mayloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related condition e.g. Creutzfeldt-Jakob disease (CDD), kuru, transmissible condition e.g. Creutzfeldt-Jakob disease (CDD), kuru, transmissible corephral amyloidosis (transmissible virus dementias), familial CUD, creepbral amyloidosis, falinemissible virus dementias), familial CUD, creepbral amyloidosis, Alzheimer's disease, prion-mediated diseases, cerebral amyloidosis, Alzheimer's disease, prion-mediated diseases, cerebral creepbral amyloidosis, Alzheimer's disease, prion-mediated diseases, cerebral creepbral amyloidosis, Alzheimer's disease, prion-mediated amyloidosis, and are capable of binding specifically to amyloid plaques. The parent sequence is a peptide forming the amyloid targeting moiety of the present sequence is a peptide forming the amyloid targeting moiety of the greent effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amyloid; imaging agent; Creutzfeldt-Jakob disease; Kuru; CJD; transmissible cerebral amyloidosis; transmissible virus dementia; scrapte; transmissible mink encephalopathy; BSE; type II diabetes; bovine spongiform encephalopathy; inflammation associated amyloid; primary amyloidosis; feline spongiform encephalopathy; diablammation associated amyloid; Albahmer's disease; prion-mediated disease; blood-brain barrier; dialysis-related amyloidosis; light chain-related amyloidosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 6;

The invention relates to an amyloid-targeting imaging agent comprising an computation transferring moiety, a linker moiety and a labelling moiety. The agent is of general formula A.t-(A.l.n.k) z-A.l.a.b. [1] where z = 0 - 1; compared in a mamyloid targeting moiety; A.l.a.b. [1] a.b. [1] a.b. [2] a.b. [3] a.b. [4] a.b. [5] a.b. [5] a.b. [6] a.b. [7] a.b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide #10, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                  New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                                                                                                                                                                                                                                ö
                                                                                                                 The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (ANU1648-AAU1669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a new method of inhibiting cerebral amyloid angiopethy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid
                                            Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide #1, used as a carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                          was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)
                                                                                                                                                                                                                                                                                                               ö

The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic
angiopathy, particularly Alzheimer's disease, hereditary cerebral hamorarhage with amyloidosis of the Dutch type and haemorrhage stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyolonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.

The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including
arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leproxy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The present sequence is an Abeta peptide used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.

                arthritis, anxylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus incers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The present sequence is an Abeta peptide used to illustrate the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
```

agent (al) that prevents contracts amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta ibril formation; or therapeutic immune response against amyloid-beta ibril formation; or therapeutic immune system modulator that prevents or inhibits amyloid-beta (ii) an immune system modulator that prevents or inhibits amyloid-beta (iii) an immune system modulator that prevents or inhibits amyloid-beta cortroprotective, cerebroprotective, haemostatic, cophthalmological, antithy anti-platishnonian, muscular, cophthalmological, anti-platishnonian, muscular, curopathic, anti-onvoltabant, anti-platishnonian, muscular, and as muscoleptic, cardiant, anti-depressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as manyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, amild-to-moderate cognitive impairment, vascular dementia, cerebral amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, communical amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, communication body myositis, disease cognition associated with Alzheimer's disease contaction to a condition associated with Alzheimer's disease contaction. disease, memory loss, anxiety, a behavioural disease, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, aggression, or incontinence). A neurological condition (e.g. apathy, disease, amyotrophic lateral sclerosis, acquired immunodeficiency, hutchison's disease, aphasia, apraxia, agnosia, pick disease, dementia with Lewy bodies, altered muscle tone, seizures, sensory loss, visual field deficits, incoordination, gait disturbance, transient ischemic attack or stroke, transient alertness, attention deficit, frequent falls, syncope, neurological condition (e.g. depression, delusions).

Syncope, neurological condition (e.g. depression, delusions).

Catack or stroke, transient alertness, attention deficit, frequent falls, haematoma, brain tumour, posttraumatic brain injury, or posthypoxic damage), or a psychological condition (e.g. depression, delusions).

Cillusion, hallucination, sexual disorder, weight loss, psychosis, a sleep disturbance, insomnia, behavioural disinhibition, poor insight, suicidal ideation, depressed mood, irritebility, anhedonia, social withdrawal, or catesins gene, an appetide manyloid precursor protein gene, an ApoE gene, or a presentlin gene; having amyloid-beta deposite. The present sequence represents a peptide in the evennifities of the can be used as an antifibiting peptide in the evennifit appetide present invention describes compositions (C) comprising: (a) a first in the exemplification of the present invention. Disclosure, Page 69; 143pp; English.

immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary)), mild cognitive impairment, can independent of mild-to-moderate cognitive impairment, amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, camyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, bown's syndrome, inclusion body myositis, age-related macular disease, nemory loss, anxiety, a behavioural disease, cardiovascular disease, candromence, any associated with Alzheimer's disease (including hypothyroidism, cerebrowascular disease, cardiovascular disease, amyotrophic lateral sclerosis, acquired immunodeficiency, disease, amyotrophic lateral sclerosis, acquired immunodeficiency, parkinson's disease, aphasia, apraxia, agnosia, Pick disease, dementia of the disease, aphasia, apraxia, agnosia, Pick disease, visual cread muscle tone, seizures, sensory loss, visual cread muscle tone, seizures, sensory loss, visual creaded deficits, incoordination, gait disturbance, transient schaemic attack or stroke, transient alertness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural catack or stroke, transient alertness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural disturbance, innomnia, behavioural distunbition, poor insight, suicidal destron, depressed mood, irritability, anhedonia, social withdrawal, or excessive guilt)) in a subject e.g. human having a genomic mutation in an ideation, depressed mood, irritability, anhedonia, social withdrawal, or amyoloid-beta deposits. The present sequence represents a peptide that can be used as an antifibrillogenic amyloidosis inhibiting peptide con the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amyloid-beta; amyloid-beta related disease;

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that a candulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune septem modulator that prevents or inhibits amyloid-beta fibril formation; or cardiomeration. Also described is a kit comprising (C). (C) have notropic, neuroprotective, rereproprotective, haemostatic, coptibliance, anticonvulsant, antichroprotective, haemostatic, coptibliance, anticonvulsant, antidepressur, endocrine and hypocit actions or inconting anyloid-beta fibril formation modulators, or copathic, anticonvulsant, antidepressur, endocrine and hypocit actions or inconting amyloid-beta fibril formation modulators, and as incontine or familial (hereditary), mild cognitive impairment, or amyloid angiopathy, hereditary or familial (hereditary), mild cognitive impairment, anyloid angiopathy, hereditary cerebroal haemorrhage, senile dementia, carebral amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, diecase, memory loss, anxiety, a behavioural dysfunction (e.g. Auntington's disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, amyoriophic lateral sclerosis, agnosia, pick disease, cament any bodies, anxiety, a behavioural dysfunction (e.g. Huntington's with Lewy bodies, anxiety, a behavioural dysfunction (e.g. Huntington's syncophic lateral sclerosis, agnosia, pick disease, dementia avith Lewy bodies, altered muscle tone, serioures, sensory loss, visual filed deficits, innoordination, gait disturbance, transient ischaemic attack or stroke, transient alertness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural channess, ballonis, alleriance and proportion denderiance. The serion or a psychological condition (e.g. dependentiance) alleriance 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               damage), or a psychological condition (e.g. depression, delusions, damage), or a psychological condition (e.g. depression, delusions, allusion, hallucination, sexual disorder, weight loss, psychosis, a sleep disturbance, insomnia, behavioural disonhibition, poor insight, suicidal ideation, depressed mood, irritability, anhedonia, social withdrawal, or excessive guilt)) in a subject e.g. human having a genomic mutation in an amploid precursor protein gene, an ApoE gene, or a presentlin gene, an ApoE gene, or a presentlin gene, that can be used as a vaccine antigen in the exemplification of the
                                                                                                                                                                                                                                                                                                                                  Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 29; DB 8; Length 6; 100.0%; Pred. The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caection (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed considerably techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cupplement. (II) and its binding pattners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of supplements. For general protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cargonishle for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

```
preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
                                                                                                                                                                                                                                   Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                        Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Alzheimer's disease; amyloidosis; amyloid-related disease; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                           Score 28; DB 4; Length 6;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48486 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                    Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.

 셤
                      The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABS262), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid candino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to peptides synthesised from the unnatural D-configuration amino acids to cavid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidomimetics. Examples include all-D peptides and immunogenic peptidomimetics. Examples include all-D peptides and 36-42 of the amyloid-beta peptide and the all-D derivative peptides in AABS2623-64. The vaccine elicits a preferential TH-2 or TH-1 response, related diseases may be localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, scrapie, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chromic infection (e.g. tuberculosis) or chromic inflammation (e.g. tuberculosis) or chromic inflammation (e.g. theumatich and every ferminal protein related disorders, or systemic amyloidosis associated with the amyloid and systemic and syste

The present sequence is that of an all-bypother surface buttenore to the preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AAB8262), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues, or by substituting 1 or more canno acid to the invention are produced using 'non-self' cavoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with a grayen of a manyloid protein, e.g. the beta-sheet region or a caption of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and associated cellular toxicity. The amyloid related diseases may be localised and the all-D derivative peptides given in AAB82623-64. The vaccine elicits a preferential Thi-2 or TH-1 response, conventing fibrillogenesis and associated cellular toxicity. The amyloid cellulated diseases may be localised amyloidosis, e.g. diabetes type II, celluted diseases, e.g. bowine spongiform encephalitis, creatzfeldt-Jakob diseases, e.g. bowine spongiform encephalitis, channed controlic infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation atthritis) and eystemic anyloid fever (FMF) and systemic cheumated diseases).
Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
                                                                                                                                                                                                                                        sequence is that of an all-D peptide suitable for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
